

EXAM AI-901: MICROSOFT AZURE AI FUNDAMENTALS (2026 BLUEPRINT)

Validates introductory knowledge of foundational AI concepts and practical application deployment using Microsoft Foundry.

DOMAIN 1: IDENTIFY AI CONCEPTS AND RESPONSIBILITIES (40-45%)

Evaluate real-world applications against the six core Responsible AI Principles: Fairness, Reliability and Safety, Privacy and Security, Inclusiveness, Transparency, and Accountability. Understand how generative AI models function, select appropriate foundation models based on client capabilities, and configure key deployment parameters like model temperature, latency rules, and inference constraints.

DOMAIN 2: IMPLEMENT AI SOLUTIONS BY USING MICROSOFT FOUNDRY (55-60%)

Understand how to use modern Microsoft Foundry projects and tools to build, deploy, and monitor interactive AI applications and autonomous agents. Implement text analytics solutions including sentiment analysis and keyword extraction. Deploy text-to-speech and speech-to-text workflows using Azure Speech tools in Foundry. Process computer vision and multimodal inputs using deployed foundational models, and utilize Azure Content Understanding features to extract structured data schemas from complex forms, text, images, audio, and video files.

TECHNICAL REQUIREMENTS & PYTHON SDK

Candidates must demonstrate basic technical implementation capacity, including familiarity with using the unified Python SDK, CLI interfaces, and REST API structures required to connect to a deployed model, manage message structures for Foundry projects, and write light client scripts for agentic applications.
